EDUCATION

Imperial College London

2022 – Present

PhD in Chemical Engineering - CASE Studentship with AstraZeneca

- Thesis title: A hybrid *in-silico/in-vitro* approach for integrated design and optimisation of large-molecule crystallisation

Imperial College London

2018 – 2022

MEng in Chemical Engineering, 1st Class Honours

EXPERIENCE

PhD Researcher, Process Systems Engineering

2022 - Present

Supervision: Dr. Maria Papathanasiou & Prof. Jerry Y. Y. Heng

- Developed and deployed physics-informed novel ML architectures (neural ODEs, transformers, autoencoders), coupled with tools such as transfer learning, reinforcement learning and hybrid modelling for improved time-series modelling of sparse and multi-fidelity datasets of biological dynamical systems. Applied neuro-symbolic methodologies for enhanced interpretability and reduced model complexity in crystallisation systems.
- Explored uncertainty quantification methods for PDE- and ML-based models. Built autodifferentiable probabilistic inference pipelines in JAX and Julia, which enabled uncertainty-aware parameter estimation, robust system optimisation and process controllability assessments.
- Built hybrid pharmacokinetic models combining mechanistic PK equations with neural networks trained on multimodal clinical data (drug administration records, electroencephalogram signals and covariates) for personalised modelling and optimal clinical trial recruitment. Used physics-informed Neural ODEs and autoregressive components to capture drug dynamics and flag anomalous trajectories for clinical applications.
- Designed ML-enhanced sensitivity analysis, model reduction and explainability tools for complex and intractable crystallisation and pharmacokinetic models.
- Conducted *in-vitro* medium-scale lysozyme crystallisation experiments with MT EasyMax and PAT tools, generating experimental evidence for template-induced protein nucleation mechanisms.

Data Scientist Intern

Jan. 2026 - Present

Quaisr, London

- Collaborated directly with pharmaceutical clients to architect and deploy agentic AI workflows, combining LLM-driven automation with domain-specific data science for end-to-end process development, from experimental design through production deployment.

Consultant Data Scientist

March - July 2025

Haleon

- Delivered ML-based soft sensors providing real-time product quality estimation from high-frequency manufacturing data, reducing reliance on offline batch testing.
- Benchmarked LSTM and transformer models against classical feature-engineered approaches, improving adaptability and robustness under imbalanced datasets and data augmentation strategies.

TECHNICAL SKILLS

Core: SciML, probabilistic programming, ODE/PDE numerical modelling, Bayesian inference and optimisation, uncertainty quantification, time-series modelling, surrogate modelling, optimization under uncertainty, RL, distributed computing, GPU acceleration

Software: Julia, JAX, Python, Pytorch, MATLAB, R, Git, Databricks, MLflow, PySpark, SQL, Docker, Azure
